A call center administrator has devised a way to provide special treatment for high profile customers, by filtering these agent's Automatic Number Identification (ANI) using a vector routing table, and interflowing these calls to be queued at a higher priority. Unfortunately, after the new VDN/vector steps were implemented, those customers are queuing to the incorrect group of agents.

What would be the reason for this?

- A.** VDN Override on VDN 7202 is set to no
- B.** VDN Override on VDN 7201 is set to yes
- C.** The caller has blocked his calling party number, a match cannot be found, and call processing for this call will cease
- D.** No agents are staffed in skill 1

**ANSWER: A**
